Are Chronic Infections Compromising Your Health?

Are You Feeling Your Best?

Think back to a time when you were at your healthiest. Do you still feel the same way? Can you pinpoint a moment in time when your health started to go downhill? Many people have not felt 100% since having a virus or other infection. If you have never fully recovered, your condition may progress from being a short-term acute infection into a longer-term chronic health complaint. Chronic infections can leave you feeling tired with muscular aches and pains and lowered immunity, making you more susceptible to catching every bug that goes around. Even a sniffly nose or cough that doesn't clear can indicate the presence of a low grade infection. With the help of your Practitioner, you can take positive steps to get truly well again.

Getting the Right Support

It takes a strong immune system to overcome persistent infections. The following herbs and nutrients help boost immunity and support your recovery:

- Medicinal mushrooms such as **cordyceps**, **coriolus**, **reishi** and **shiitake** are potent immune enhancers for chronic or recurrent infections.
- **Astragalus** possesses anti-viral activity and assists in the prevention and treatment of chronic infections.
- **Zinc** helps reduce the severity and duration of colds and flus; however zinc deficiency can compromise immunity. Ensure you have adequate zinc levels to help your immune system fight against infection.
- **Vitamin D** plays an important role in regulating the immune system. Surprisingly high numbers of adults have inadequate vitamin D levels, so have your levels checked regularly.
- **Vitamins A, C, and E** are all beneficial for supporting healthy immunity.

The Gut - Immune Connection

In order to have a healthy, thriving immune system, you need to ensure your digestive system is also healthy. With 70% of your immune system in the gut, the microflora or friendly bacteria play an important role.¹ Probiotics are beneficial strains of friendly bacteria that can boost your immune system function. The strains, *Lactobacillus acidophilus* NCFM, *Lactobacillus rhamnosus* HN001 and *Bifidobacterium lactis* HN019 may help support healthy immunity.

The Journey to Wellness

A chronic condition was once acute. If your body is unable to successfully recover from an acute infection, it may develop into a chronic health concern that your immune system can't get the better of. Allowing your body to heal from a chronic infection can take time; the longer you have been sick, the longer you may need to get well again. Whilst you may feel relief in the short term, persisting with herbs and nutrients can provide long term relief from the nagging symptoms you have grown accustomed to. Remember how great it feels to be 100% healthy again!
